SAN DIEGO (GenomeWeb) – A University of New South Wales-led team has sequenced and assembled a desert dingo genome de novo in the hopes of untangling canine domestication in general, along with the dingo's own history in Australia.

UNSW biotechnology and biomedical sciences researcher Bill Ballard presented the work during a PacBio workshop at the Plant and Animal Genome conference here yesterday. He noted that the research follows from pioneering work by the late Alan Wilton, a geneticist at the UNSW, who established a large dingo DNA repository.
